This Energy Machines™ EMHP model contains two refrigerant circuits with a semi-hermetic reciprocating compressor in each. Together with frequency inverters, the EMHP model has the capability of providing either high turndown or extra capacity when required. The two refrigerant circuits are completely independent, ensuring the stability of the heating supply.

The EMHP model is specifically designed for heating and cooling purposes. It can handle large pressure drops on the water side using the machine's internal water pumps.

The EMHP comes as a complete heat pump and cooling system in one unit.
